FOREWORDS

Michael Tiedemann
CEO, ALTi Tiedemann Global

ALTi Tiedemann Global

ALTi was created to meet the needs of multi-generational global wealth holders, delivering impact, legacy and purpose for some of the most discerning and dynamic owners of capital in the world. As families move from success to significance, the concept of ‘permanence’ expands – encompassing not just what is best for individual families, but also for communities and the world in which we all seek to thrive. Many start to consider the purpose of their capital, and that the value they can offer is financial and extra-financial, is economic and social.

Traditional financial metrics have long-informed investment decisions. However, these indicators do not capture the full picture of risk and opportunity. Of equal importance is the need to assess and consider extra-financial challenges. Today's interconnected markets demand a broader lens, one that incorporates non-economic measures of social progress, resilience, prosperity and sustainability.

Integrating consideration of financial potential with social progress is challenging. That is why we have partnered with the Social Progress Imperative, a non-profit organization, who have been undertaking meticulous, robust, data-driven research across 170 countries, covering 99% of the global population, for more than 10 years.

The ALTi Global Social Progress Index is a powerful and practical tool that shows how people are really living and examines the core drivers of social progress, as distinct from economic indicators. The Index identifies areas where there's a real chance to accelerate change and support meaningful social progress.

Many of our clients – whether individuals, families or foundations – ask us how their capital can make a difference in the world. Many want to know how their resources might contribute not only to the generation of positive financial returns but also to social returns. The Index offers a performance backdrop against which we might all assess how we are progressing to create positive impact in the world and where focused investments of private capital might contribute to that progress over multiple generations and decades.

There is no single answer to the challenges of our time. However, there are opportunities to engage in advancing evidence-based responses to those challenges. Those responses in turn position today's families to not simply *leave* a legacy but *live* a legacy of positive engagement with markets, communities and ecosystems.

Our hope is that the Index will spark many conversations, far beyond our own client base, across the private capital universe, as we work to create the world, we aspire to leave our children and grandchildren, our own generations and those yet to come.

Social Progress Imperative

Leaders across the world are hungry for economic growth. Countries have been burdened by the costs of the COVID pandemic. They are facing the twin challenges of managing extreme weather caused by climate change and transitioning to a new energy paradigm. The demographic rupture of an aging population with fewer younger people to support them threatens to overwhelm our already strained health and social care systems. Higher GDP will give countries more resources to manage these problems.

Yet economic growth alone is not a panacea. The 2025 AITi Global Social Progress Index shows that, since COVID, rising GDP has not led to real improvements in people's lives. In elections all around the world last year, incumbent leaders who campaigned on their economic record without improving social progress suffered at the polls. Advancing social progress is not just a moral imperative. It is a smart strategy for political leaders and is the foundation of thriving economies.

This report shows that economic growth that is inclusive - that delivers social progress - is possible. It highlights countries that have bucked the global trend and delivered real improvement in the lives of their citizens. It also shows that there is so much potential, across countries rich and poor alike, to accelerate social progress. We may live in challenging times, but we should not submit to fatalism. Rather, we need to learn faster from the countries that are succeeding and scale solutions that work.

Private capital has a critical role to play in helping to create societies that deliver for all. That is why the Social Progress Imperative is excited to have started a new partnership with AITi Tiedemann Global. I am thrilled that, with AITi Tiedemann Global's expertise, we can use this report for the first time to shine a light on the biggest opportunities to advance social progress globally.

Michael Green
CEO, Social Progress
Imperative

01

SUMMARY

2025 has the potential for investors to make the biggest difference in a decade.

The world is undergoing a period of turbulence: the COVID epidemic slowed or reversed economic and social progress; there is a crisis in political systems as liberal and authoritarian models jostle for position; geopolitical tensions are peaking across multiple regions; and the climate emergency accelerates with ever more tangible impacts. Ten years ago, the United Nations committed to accelerating progress towards a sustainable future where no one is left behind. Yet, two-thirds of the way to these 2030 Sustainable Development Goals ('SDGs'), meeting this objective appears to be slipping away.

The 2025 AITi Global Social Progress Index ('the Index') tracks 57 indicators of social progress for 170 countries since 2011. The Index shows how the world has slowed its progress towards the SDGs. Yet there are good reasons for investors to see opportunities to make a tangible difference now with the prospect of a strong social progress recovery. The Index unpacks the different factors that are driving this slowdown, providing insight into opportunities for a social progress recovery.

The Index results suggest four key areas for private capital to make a difference:

A HEALTHIER WORLD

Health outcomes globally were dented by COVID, but there has been a strong rebound in life expectancy. Areas to make the biggest difference will be in:

Tackling hunger: Undernourishment blights health and progress has stagnated in many regions of the world; investment in the production, supply, and distribution of food has strong potential to accelerate progress.

Water and sanitation: Investments in this sector deliver strong spin-off benefits to health and education; most regions are close to solving this. South Asia and Sub-Saharan Africa still have some way to go but with strong prospects for further advancements.

Fixing health systems: Confidence in quality healthcare has slumped in many advanced economies while demand is likely to grow due to aging populations. Successful innovation in this sector will pay a large social dividend.

REBUILDING RIGHTS AND FREEDOMS

There has been a decade-long retreat on rights and freedoms, particularly of the media, across countries and all regions, developed and developing. However, this is an area where countries moving in the right direction can make strong progress quickly if supported.

SUSTAINABILITY OPPORTUNITY

Clean energy technologies for lower-income regions such as South Asia and Sub-Saharan Africa have huge potential for the environment and will positively impact health outcomes by reducing particulate air pollution. There is also a huge untapped market across the world for reuse of waste to improve circularity.

GENDER EQUITY

Recent years have seen some big gains for women's health and education, but progress has been slower on early marriage, access to contraception, and, in particular, domestic violence. Tackling these problems will help to unlock untapped opportunities for women globally.

The ALTi Global Social Progress Index also powerfully demonstrates that while economic growth is correlated with high social progress, economic growth alone is not enough. Countries

of similar GDP per capita can have widely different levels of social progress and growth without social progress is a real risk. GDP is not destiny.

Social progress is defined as the capacity of a society to meet the basic human needs of its citizens, establish the building blocks that allow citizens and communities to enhance and sustain the quality of their lives, and create the conditions for all individuals to reach their full potential.

Introducing the AITi GLOBAL SOCIAL PROGRESS INDEX

The AITi Global Social Progress Index is distinct in its comprehensive approach and rigorous assessment of the wellbeing of a society. It is designed to measure progress and drive actions in advancing the quality of life in communities around the world. Independent of economic performance, the Index shows precisely how people are really living and who is being left behind. Policymakers, investors, businesses, and countries' citizens can use the Index to benchmark success, identify specific areas of strength or weakness to prioritize, and learn from others.

The 2025 AITi Global Social Progress Index tracks the performance of 170 countries from 2011 to 2024 across key drivers of social progress. It combines 57 social and environmental outcome indicators to calculate an overall score for these countries, based on measures in health, safety, education, rights, and more. It also considers the data of 26 additional countries, calculating component and dimension scores when enough data are available.

Figure 1

Social Progress Index Indicator-Level Framework

Source: AITi Global Social Progress Index

BASIC NEEDS

Nutrition & Medical Care

- Undernourishment
- Maternal mortality
- Child mortality
- Child stunting
- Infectious diseases
- Diet low in fruit and vegetables

Water & Sanitation

- Basic water service
- Basic sanitation services
- Unsafe water, sanitation and hygiene
- Satisfaction with water quality

Housing

- Access to electricity
- Household air pollution
- Dissatisfaction with housing affordability
- Usage of clean fuels and technology for cooking

Safety

- Interpersonal violence
- Intimate partner violence
- Money stolen
- Feeling safe walking alone
- Transportation related injuries

FOUNDATIONS OF WELLBEING

Basic Education

- Primary school enrollment
- Secondary school attainment
- Gender parity in secondary attainment
- Equal access to quality education
- Children grow and learn

Information & Communications

- Mobile telephone users
- Internet users
- Access to online governance
- World Press Freedom Index

Health

- Life expectancy at 65
- Non-communicable diseases
- Access to essential health services
- Equal access to quality healthcare
- Health problems

Environmental Quality

- Outdoor air pollution
- Particulate matter pollution
- Lead exposure
- Waste recovery

OPPORTUNITY

Rights & Voice

- Political rights
- Freedom of peaceful assembly
- Equality before the law & individual liberty index
- Rights equality
- Perception of corruption

Freedom & Choice

- Vulnerable employment
- Early marriage
- Satisfied demand for contraception
- Freedom over life choices
- Civil Society Organization (CSO) repression

Inclusive Society

- Acceptance of gays and lesbians
- Discrimination and violence against minorities
- Equal access index
- Count on help
- Young people not in education, employment or training

Advanced Education

- Expected years of tertiary education
- Women with advanced education
- Quality weighted universities
- Citable documents
- Academic freedom

'Social progress' is defined as the capacity of a society to meet the basic human needs of its citizens, establish the building blocks that allow citizens and communities to enhance and sustain the quality of their lives, and create the conditions for all individuals to reach their full potential.

This definition, established in consultation with academic and policy experts representing diverse perspectives, drives the framework of the Index. This refers to three dimensions of social progress: Basic Needs, Foundations of Wellbeing, and Opportunity. Under each dimension are four components whose underlying concepts are guided by questions we seek to answer with available data. Each component is further defined by a set of outcome indicators that respond to the conceptual questions posed.

Together, these interrelated elements combine to produce a given level of social progress. The Index methodology allows measurement of each component and each dimension, yielding an overall score and ranking.

To provide an intuitive understanding of absolute performance, the scores for indicators, components, dimensions, and the overall Social Progress Index are scaled from 0 to 100, with 100 representing the best possible scenario and 0 indicating the worst possible.

The Social Progress Imperative's approach builds on a long line of work constructing country indices to measure and assess various facets of economic and social performance. However, the AITi Global Social Progress Index is distinct in its core methodological choices:

A focus on non-economic dimensions of national performance.

A measurement approach based on outcome indicators, rather than input measures.

A holistic framework consisting of three broad dimensions of social progress, each of which is the average of its four components.

Calculation of each component as the weighted average of a series of measures, with the weights determined through principal component analysis.

The Index is explicitly focused on non-economic aspects of national performance. Unlike most other national measurement efforts, social progress is treated as distinct from, though associated with, more traditional economic measures such as Gross Domestic Product ('GDP') per capita. In contrast, other indices such as the Human Development Index or OECD Better Life Index combine economic and social indicators. The objective is to utilize a clear yet rigorous methodology that isolates the non-economic dimensions of social performance to best guide policies, investments, and actions to advance progress for all. Moreover, by isolating and measuring social progress directly, we can analyze the relationship between economic performance and social outcomes. This helps create a better understanding of the necessary conditions for economic growth to support better lives, as well as the social factors that drive sustained economic success.

DRIVERS OF SOCIAL PROGRESS

Economic growth is an important driver of social progress.

But GDP is not destiny – at any level of GDP per capita some countries are better than others at turning their economic resources into social progress.

The world has the economic potential to achieve a significantly higher level of social progress than it achieves currently.

The ALTi Global Social Progress Index explicitly excludes economic indicators to provide a clear understanding of the relationship between economic and social performance. A key finding of this research is that social progress is strongly related to economic growth. Economic growth has been, and will continue to be, a critical driver of the lived experience of people around the world. This is most important for countries

with lower incomes today. Lifting the lowest income countries economically through trade and investment is essential for accelerating social progress. However, while relatively small increases in GDP per capita are associated with significant gains in social progress for lower income countries, there are diminishing social progress returns to higher GDP for higher income countries (Figure 2).

Figure 2

**Social Progress Index scores
vs GDP | 2024**

Source: ALTi Global Social Progress Index

Yet Figure 2 also shows that GDP is not destiny – GDP does not fully explain social progress outcomes. For instance, Denmark and the U.S. have similar GDP per capita, but U.S. social progress is ten points lower (Figure 3). The U.S. has social progress results comparable to Latvia, despite Latvia’s GDP per capita being half that of the U.S. The same holds true for lower GDP countries:

The Gambia and the Central African Republic have similar GDP per capita but The Gambia’s social progress is more than 20 points higher.

Vietnam’s GDP per capita is slightly lower than Egypt’s but its social progress is more than 13 points higher.

Figure 3

**Social Progress Index vs GDP
highlighting select countries | 2024**

Source: AITi Global Social Progress Index

The relationship between economic and social progress has also weakened in the years since COVID. The last five years' global growth has been particularly non inclusive (Figure 4). This

may be because the economy has rebounded faster than social indicators and inclusive growth will be restored in time.

When examining the world's social progress performance relative to its GDP per capita, accelerating social progress entails addressing two challenges:

Challenge A

In general, increasing GDP per capita through economic growth is correlated with higher levels of social progress. Therefore, supporting economic growth in lower income countries, where the social progress payoff to increasing GDP is greatest, will be important.

Challenge B

The world is underperforming in social progress relative to its GDP per capita. Vietnam, for example, has a lower GDP per capita than the world's average but scores seven points higher in terms of social progress (Figure 5). Making the economic resources we already have available to us work harder to deliver social outcomes is an important way to raise world performance.

ALTi insight

Why are some countries better than others at turning their economic resources into social progress? And what does that mean for investors?

Some countries excel at turning economic resources into social progress because they have the ability to leapfrog traditional development pathways. Starting from a low economic or infrastructural base can be an advantage: these countries are unburdened by entrenched systems, outdated policies, existing transportation and energy infrastructure, or cultural norms that sometimes hinder adaptability and innovation in more developed contexts.

Leapfrogging allows nations to bypass intermediate stages of development and adopt cutting-edge solutions, from renewable energy systems to digital finance and digital health platforms. Countries with limited legacy infrastructure can deploy mobile networks and decentralized solutions more quickly than those needing to overhaul existing systems

For example, Ethiopia and Rwanda are showing global leadership in the global energy transition – in particular, [Ethiopia has recently effectively banned the import of gasoline and diesel cars](#). The primary reason is the cost of importing petrol and diesel, whereas the country has abundant clean energy through hydropower. Those emerging economies with a high percentage of

renewable energy production (often due to hydropower or geothermal) can be well-placed to leapfrog other countries in the adoption of electric vehicles.

It is still very early days for the Ethiopian policy and there are many other factors in facilitating a successful transition to electric vehicles, for example, sufficient charging infrastructure.

For investors, markets with leapfrogging potential offer unique opportunities to support scalable, high-impact innovations that not only yield competitive financial returns but also drive transformative social progress by capitalizing on their ability to bypass legacy barriers.

Leapfrogging reflects two of six megatrends identified by ALTi which are shaping markets for the long-term: 'Changing Face of Finance' and 'Climate Crisis'. These trends create a tailwind for attractive returns that can also positively impact the environment and society, signaling a powerful convergence of investment opportunity and social progress—unlocking the potential for financial returns alongside measurable benefits for governments, communities, and investors worldwide.

Megatrend definitions:

Changing Face of Finance

There are multiple changing dynamics in the finance ecosystem. Ongoing structural inflation, larger fiscal deficits and an end to the bull market in bonds all have implications for finding yield and return opportunities. In addition, the digital currencies and payments landscape, including numerous implications from blockchain technology, continues to evolve.

Climate Crisis

We believe the impact of the climate crisis includes an increased need for energy independence with implications for old and new energy sources and new decarbonization technologies. 2024 was the warmest year on record, increasing the need to accelerate investment in this area.

AITi insight

How focusing on the world's most vulnerable communities has the potential to drive transformative growth.

Social polarization and ageing demographics are another two of AITi's six megatrends that are shaping markets for the long-term

Moving capital to the world's most vulnerable communities demands bold and innovative strategies - many of which are considered high-risk and utilize less-proven financial vehicles. However, for investors with the appetite, vision and capacity to act, leveraging diverse capital sources, employing targeted tools, and focusing on populations with the potential for outsized social and economic impact can drive transformative growth while achieving both financial and extra-financial returns.

Diverse capital sources

Capital flow to vulnerable regions requires a strategic blend of funding types. Philanthropic capital can de-risk early-stage projects, paving the way for other forms of investment. Patient and catalytic capital, which can require a longer-term horizon or carry an intentionally lower return to investors, are vital for nurturing growth, as evidenced by the post-COVID recovery of many microfinance portfolios (financial services for individuals or small businesses who are typically excluded from traditional financial services). Additionally, public-private partnerships and blended finance models bring together institutional, governmental, and private resources to amplify impact and share risks.

Innovative financial tools

Reaching emerging markets requires financial instruments capable of managing risk and scaling effectively, but these tools are not universally accessible to all investors. Microfinance, for example, has demonstrated its potential to empower underserved communities to drive local economic growth, yet it remains risky, requires expert due diligence and research and may seem inaccessible to mainstream investors. Similarly, blockchain-based bonds promise increased transparency and efficiency in cross-border investments but are still nascent and largely unproven at scale. These barriers highlight the need for further innovation and de-risking strategies to make these tools more broadly viable and impactful.

Investing in populations with the potential for outsized social and economic impact

Underrepresented fund managers and founders face significant barriers in accessing investment capital leaving many companies undervalued despite demonstrating strong fundamentals. From this perspective, creating more inclusion is a compelling financial opportunity.

More broadly, investing in underrepresented groups can play an important role in driving economic recovery and enhancing social resilience. Women historically tend to reinvest in their families and communities, multiplying the social and economic returns of investment. Refugee-focused initiatives highlight how displaced populations, when empowered, can fuel entrepreneurship and GDP growth. As climate change exacerbates displacement, targeting these populations can help foster resilient and inclusive economies worldwide.

Different ways of investing for consideration

Catalytic Debt: Provides flexible, low-cost capital to fund resilience-building projects in vulnerable communities, de-risking investments and enabling sustainable development. It includes right-priced loans to social enterprises,

microfinance institutions, and climate resilience projects, bridging funding gaps and driving local economic growth in underserved communities.

Private Equity and Venture Capital: Back ventures developing scalable solutions for vulnerable populations, such as blockchain financial tools, refugee entrepreneurship programs, or women-focused economic empowerment initiatives.

Cash and Cash Equivalents: Allocate to mission-aligned deposit programs or community development financial institutions (CDFIs) that focus on providing liquidity to underserved populations.

Commodities: Target sustainable commodity investments tied to inclusive supply chains, such as fair-trade agriculture or ethically sourced minerals, which directly support economic opportunities for vulnerable groups.

Megatrend definitions:

Social Polarization

Ongoing social polarization for the underrepresented and under-resourced has implications for affordable housing, access to education and financial inclusion. There is also potential for technological innovations to provide new opportunities for improved access.

Ageing demographics

As societies age we see implications for increased government support and fiscal burdens as well as significant innovation in the life sciences sector driven by rapid advancements

in the understanding of human biology and breakthroughs in technology. There are also opportunities for the digitalization of healthcare to lower costs while Gen AI may significantly reduce the time of new drug discoveries, potentially reducing costs and enhancing outcomes. More broadly, investing in the healthcare sector can provide stability and growth during downturns due to its essential nature and constant demand.

OPPORTUNITIES TO MAKE A TANGIBLE DIFFERENCE

The ALTi Global Social Progress Index identifies four major opportunities for investors to make a difference:

1. A healthier world through investments in food security, water and sanitation and health systems.
2. Rebuilding rights and freedoms through support for rule of law, independent media and academic freedom.
3. The sustainability opportunity of clean energy technology and the circular economy.
4. Accelerating progress towards gender equity by supporting efforts to tackle persistent problems like intimate partner violence.

1 A Healthier World

COVID has been a significant drag on social progress performance since 2020. The scale of the impact is evident when you consider that it led to a reversal in the long-run trend of rising life expectancy, which dipped by eight points because of COVID (Figure 6).

The COVID effect is fading. Life expectancy has bounced back, and other health indicators may follow. Knock on effects of the pandemic on education, such as a decline in secondary school attainment, may also recover.

Three areas are critical for an acceleration in global health:

Hunger

Undernourishment has a multi-generational negative impact on health. Ensuring populations have reliable access to healthy food systems is a bedrock to fostering a thriving population and economy. Investments in regenerative agriculture, innovations in farming systems and technology and intentional investment in water and irrigation systems can work towards eliminating hunger and boosting long-term trends in health globally. Yet half the world still faces major challenges in nutrition. Sub-Saharan Africa is the worst affected region and has deteriorated since 2014, and South Asia has seen a significant worsening since COVID. Latin America & the Caribbean and the Middle East &

North Africa perform better, but the trend has been declining for several years (Figure 7). The countries that have made the most and the least progress on undernourishment are set out in Figure 8.

Water and sanitation

Clean water and good sanitation have been the foundation of improvements in public health for centuries and have positive effects on school attendance and attainment. The world has made sustained progress in bringing water and sanitation to everyone. But there is still work to do (Figure 9). Sub-Saharan Africa lags significantly behind the rest of the world on this issue, and South Asia needs to maintain its current trajectory to catch up. Progress has stalled in the Middle East & North Africa. Across many regions, there is evidence of a 'last mile' problem that needs to be addressed.

Notably, eight out of the ten most improved countries on water and sanitation since 2011 are in Sub-Saharan Africa, led by Nigeria (Figure 10).

Figure 10

Most improved countries in Water & Sanitation since 2011

Source: ALTi Global Social Progress Index

Health systems

There has been significant improvement in basic health systems around the world, driven by public and private development finance. The 10 most improved countries in the world on access to essential health services are all in Sub-Saharan Africa (Figure 11).

As spending on healthcare has spiraled in the developed world, indicators of health system effectiveness and equity have declined consistently for many countries (Figure 12). As the world faces a large demographic transition to an

older population, we can only expect the demand for healthcare to rise, putting further pressure on health systems. Government-led reform of the financing and delivery of healthcare is urgently needed. So too is innovation in preventative medicine to help people live healthily for longer and new models and technologies for healthcare delivery that are more cost effective than existing solutions. The health sector may be one of the sectors where new Artificial Intelligence technologies could make a big difference.

Figure 11

Most improved countries in Essential Health Services since 2011

Source: AITi Global Social Progress Index

Figure 12

Equal Access to Healthcare indicator for select countries | 2011 - 2024

Source: AITi Global Social Progress Index

Across many regions, there is evidence of a ‘last mile’ problem that needs to be addressed.

The ‘last mile’ refers to the final stage of a journey or product in reaching its destination. It is commonly used to describe the gap in infrastructure and essential services for rural and developing areas.

ALTi insight

How can investors address the 'last mile' problem?

Addressing the 'last mile problem' in infrastructure requires innovative, scalable solutions that connect underserved communities to essential services. Investors can play a pivotal role by backing projects in renewable energy, mobile networks, water, sanitation, and decentralized utilities, all of which provide vital access to infrastructure in rural areas.

Public-private partnerships (PPPs) are particularly effective in these settings, enabling collaboration with governments to de-risk investments by sharing financial burdens and ensuring that projects lead to tangible improvements for these communities.

'Last Mile' opportunities

Leapfrogging technologies, such as solar-powered water pumps and low-cost water filtration systems, enable communities to bypass traditional, costly infrastructure, accelerating development and driving local economic growth. Water and sanitation access, with its significant health and economic benefits, can improve quality of life, boost productivity, and prevent disease outbreaks. However, water and sanitation are just one aspect of the broader infrastructure challenge. Other investible opportunities, including mobile payments, microfinance, solar microgrids, satellite internet, and digital health platforms, play a key role in addressing the last mile problem and driving long-term, sustainable progress.

Portfolio benefits

For investors, these opportunities not only deliver high social impact but also provide significant portfolio benefits. By investing in last-mile infrastructure, including water and sanitation, investors tap into high-growth emerging markets, that diversify risk and are likely to deliver stable returns. These investments offer long-term stability as they focus on essential services that are less vulnerable to market fluctuations and can generate sustainable returns, positioning capital for growth in resilient, inclusive economies.

Different ways of investing for consideration

Public Equities: Invest in publicly traded companies driving last-mile solutions, such as solar microgrids, water purification, satellite internet, and digital health platforms.

Fixed Income: Support infrastructure development through green or sustainability-linked bonds, including renewable energy, decentralized utilities, sustainable mass transit, and rural water and sanitation projects.

Private Equity and Venture Capital: Back innovative startups and growth-stage ventures, such as solar-powered water pumps, filtration systems, mobile payment platforms, and digital health solutions.

Real Assets: Directly invest in physical infrastructure like solar farms, water distribution systems, mobile network towers, and decentralized utility hubs in underserved regions.

AITi insight

Investment to support an evolution in agricultural practices could be crucial for combatting world hunger.

World hunger intersects with a number of critical global challenges, including climate change, food security, and public health. While global agriculture practices have made remarkable strides in feeding billions, new approaches like regenerative agriculture may be key to addressing persistent hunger and safeguarding the planet's future.

The role of regenerative agriculture

The concept is simple but powerful: farm in ways that not only produce abundant, nutritious food but also regenerate the soil, enhance biodiversity, and sequester carbon. This approach can help reverse decades of environmental degradation while bolstering farmers' livelihoods and strengthening food systems against climate shocks. Yet the execution is far from simple. It demands cutting-edge technology, improved farming practices, and innovative financial solutions to help farmers transition to regenerative methods.

The future of food investment spans all asset classes

For investors, regenerative agriculture provides a unique opportunity to align financial returns with a widespread positive impact. Investments range across asset classes from agricultural technology innovation and sustainable

real estate to private equity in agricultural supply chains. Supporting farmers in adopting these practices can boost profits, rejuvenate ecosystems and strengthen food systems.

Ending hunger is not just about producing more food but ensuring that food systems are resilient, efficient, and equitable. By integrating regenerative agriculture with traditional farming practices and supporting these efforts through targeted investments and technological advancements, we can create sustainable systems that support access to healthy food.

Investors can consider the following capital deployments that can deliver both financial and extra financial value.

1. Blended finance: This approach combines concessional funds with private capital to finance regenerative projects. Concessional funds, typically from development finance institutions, state-owned banks, philanthropists, and impact investors, help de-risk investments by providing a cushion against potential losses.

2. Private equity and vertical integration: These approaches bring together various parts of the agricultural value chain, including input procurement, regenerative production, and carbon

credits. This integration provides incentives and scale to promote regenerative production upstream.

3. Regenerative project finance: This method allows large-scale regenerative agriculture projects to receive capital at the beginning of the project lifecycle based on long-term commercial viability. Debt and equity are repaid with cash flow generated by the project's commodity or environmental market revenues.

Different ways of investing for consideration

Public Equities: Invest in companies advancing regenerative agriculture through innovative farming technologies, sustainable supply chains, and climate-resilient food production systems.

Fixed Income: Support agricultural transitions through green bonds and sustainability-linked debt, financing soil health initiatives, biodiversity enhancement, and climate-smart infrastructure projects.

Private Equity and Venture Capital: Back startups and growth-stage companies developing ag-tech solutions, such as precision farming, carbon sequestration technologies, and regenerative supply chain innovations.

Real Assets: Direct investments in agricultural land focused on regenerative practices, sustainable farmland management, and food production infrastructure. Additional investments can also be made in marine conservation, sustainable fisheries and the expansion of protected areas.

2 Rebuilding Rights and Freedoms

There has been a long-term decline in the world score on rights and freedoms for more than a decade across a wide range of measures (Figure 13). This trend has affected almost every region of the world (Figure 14). Only Central Asia & the Caucasus region has a higher score on Rights & Voice in 2024 than in 2011, but it remains the lowest-scoring region. North America has been and remains the strongest region on these issues yet there has been a steep decline since 2017. Europe has shown a more gradual decline across the whole period. South Asia, which has been one of the better performing emerging

regions on these measures, has declined in recent years. Sub-Saharan Africa, East Asia & the Pacific, and Middle East & North Africa have stagnated since 2011.

The only region that has seen a recovery in scores on Rights & Voice in the last year is Latin America & the Caribbean, driven by a big improvement in Brazil following the election of Lula da Silva in 2023. This is not yet a trend for the region as a whole. Brazil's experience shows how rights are tied to political change. The worldwide decline in Rights & Voice reflects a period where populist

Figure 16

Rights & Voice for select countries | 2011 - 2024

Source: ALTi Global Social Progress Index

Figure 17

World Information & Communications and Press Freedom scores | 2011 - 2024

Source: ALTi Global Social Progress Index

Figure 18

World Acceptance of Gays & Lesbians and Academic Freedom scores | 2011 - 2024

Source: ALTi Global Social Progress Index

authoritarians have held power, such as Turkey and Hungary. There has also been a tightening of control in countries like Russia, China, and Venezuela. (Figures 15 and 16).

Declining rights are also manifested in a slump in press freedom around the world, across every region, which has pulled down the world's score on Information & Communications in recent years (Figure 17).

We also see signs of rising intolerance, for example, with a decline across all regions of acceptance of gays and lesbians and declining academic freedom (Figure 18).

While political processes are the main determinant of performance on rights and freedoms, there are several opportunities for private investors:

Media freedom and quality: Businesses influence the media environment as direct owners of media companies and social media platforms. But they also influence advertisers.

Philanthropic capital is also crucial in its choice of political causes and in supporting organizations defending and promoting human rights.

3 The Sustainability Opportunity

Sustainability is an integral part of the UN's SDG agenda and is the subject of high-level intergovernmental negotiations through the Conference of the Parties ('COP') process. Yet progress on Environmental Quality remains slow and there is no sign of acceleration (Figure 19).

On a regional basis, we see the largest improvement in the Middle East and North Africa and Europe. South Asia is the only region to experience declining Environmental Quality since 2011 (Figure 20).

The challenge countries face is the perceived tradeoff between economic growth and sustainability. As economic activity increases so does energy demand, which is currently being met with technologies that pollute the atmosphere. When we examine particulate air pollution by region, South Asia and Sub-Saharan Africa, the world's lowest income regions striving

to develop, are experiencing deteriorating air quality (Figure 21). Yet this tradeoff need not exist. The solution is for developing countries to leapfrog their energy technologies and move quickly to new, clean energy sources. As these technologies become more affordable, the faster this process will happen. There is a clear investment opportunity for private capital to accelerate this process, which will not only deliver environmental benefits but also address the significant negative health impacts of particulate air pollution.

There is also a huge opportunity in the circular economy. Only Europe has made any progress in waste recovery. Most regions are moribund on this measure, North America is deteriorating (Figure 22). Reducing resource use through waste recovery to build circular economies is fundamental to a sustainability agenda and one that is ripe for investment.

AITi insight

The perception that there is a tradeoff between economic growth and sustainability is misleading and in reality, the two are intertwined.

As climate change accelerates, the financial consequences and risks become increasingly widespread and apparent. Alongside these risks, there is significant scope for investors to support the transition to a net-zero economy and generate strong returns in the process.

Climate risks and financial stability

Climate change is no longer a distant threat—it's already impacting asset values and financial systems. Rising natural disasters and temperatures are destabilizing property values, insurance availability, and credit access, with far-reaching consequences for investors and the broader economy. As the cost of extreme weather events continues to rise, the risks to financial portfolios and the increasing human cost are becoming more evident.

Investment opportunities in climate solutions

The shift to a net-zero economy also creates significant investment opportunities. With \$135 trillion needed to decarbonize the global economy by 2050, sectors like renewable energy, carbon capture, and sustainable technologies are seeing rapid growth, fueled by strong policy support. Investors who capitalize on these opportunities can not only mitigate risks but also benefit from the long-term growth potential in climate solutions.

Different ways of investing for consideration

Public Equity: Invest in companies leading the net-zero transition, such as renewable energy providers and firms specializing in energy storage and electric vehicle infrastructure.

Fixed Income: Green and sustainability-linked bonds offer stable returns while funding climate-focused projects, including renewable energy and emissions-reduction efforts.

Private Equity and Venture Capital: Invest in high-growth, early-stage companies developing innovative climate solutions like carbon capture, green hydrogen, and grid-scale battery storage.

Real Assets: Direct ownership in renewable energy infrastructure or sustainable real estate projects offers long-term stability and inflation protection.

Infrastructure Funds: Focus on large-scale decarbonization projects like EV charging networks and renewable energy grids to support the transition to a net-zero economy.

4 Accelerating progress towards gender equity

The AITi Global Social Progress Index seeks to apply a gender lens across all components of the data model, as far as possible. When we look at some of the women-specific indicators together we see that there is some progress and opportunities to go faster (Figure 23).

Progress has been fastest in providing women access to higher education. This reflects the widening of access to higher education in general, servicing the expanding global middle class, despite remaining obstacles to education for women and girls and discrimination against women in many countries. In some advanced countries, the gender issue in school education

has even flipped around with boys lagging behind girls in educational attainment.

Access to contraception and combatting maternal mortality and early marriage have continued to improve slowly. Yet it remains a challenge in many countries (Figure 24). On each of these measures, we see some big improvements in lower income countries partially offset by declines in more advanced, sometimes high-income, countries that are slipping backward.

There is no progress on intimate partner violence against women, which has stagnated or worsened in every region except North America (Figure 25).

AITi insight

Is there a global right-tail event on the horizon?

A **right-tail event** in finance refers to a rare, high-impact occurrence with low probability but the potential for significant positive returns, such as a market boom or breakthrough innovation. It represents an opportunity for outsized gains, contrasting with the risks of left-tail events, which are associated with low probability, but steep, financial losses.

One of the most significant right-tail events could be the global economic and social transformation that would result from tackling gender-based violence ('GBV'). GBV is pervasive and ubiquitous, affecting all demographics—across the wealth spectrum, young and old, across all races and geographies. It is not confined to one part of society but transcends every boundary, with profound consequences for individuals and economies alike. [Violence against women is estimated to cost \\$1.5 trillion worldwide, according to the United Nations](#), and [according to the World Bank costs some countries up to 3.7% of their gross domestic product](#).

Addressing GBV requires multi-faceted, systems-change action, including robust policy reforms, targeted philanthropy, and strategic investments. The economic cost of GBV is huge, from healthcare expenses to lost productivity and workforce participation. If these barriers were removed—through coordinated

efforts to reduce violence, support survivors, and create more equitable systems—it could lead to a significant uplift in economic productivity worldwide.

Addressing the root causes of GBV and supporting prevention and recovery initiatives, could result in a massive increase in workforce participation, reduced healthcare costs, and a stronger, more resilient global economy. This systemic shift could create a lasting, positive impact across regions, propelling societies toward more inclusive and prosperous futures.

Did you know?

Enforcing gender-based protection policies doesn't just improve lives—it also strengthens a nation's economic standing. Countries that rigorously implement and uphold laws against GBV are often perceived as more stable and equitable, which can positively impact their sovereign credit ratings. Higher sovereign ratings signal reduced risk, leading to lower borrowing costs for governments as sovereign debt becomes more attractive to global investors. By creating safer environments and fostering gender equity, nations not only uplift their populations but also enhance their fiscal resilience and global reputation, driving a virtuous cycle of economic and social stability.

FINDINGS

There has been a stagnation of global social progress since 2020, driven by the COVID pandemic and a chronic decline in rights and freedoms.

There is an opportunity for a strong rebound as COVID impacts wane. The example of the most improved country in the last year, Brazil, shows that rights can rebound quickly.

The G7 and other advanced countries show slower progress; faster gains are coming from emerging economies.

Social Progress Trends | 2011-2024

The AITi Global Social Progress Index aggregates 57 outcome indicators for 170 countries, covering more than 99% of the world's population. The world's population-weighted score has risen from 58.99 out of 100 points in 2011 to 64.02 in 2024, yet most of that improvement was from 2011 to 2020 (Figure 26). Since the onset of COVID, social progress has stalled globally.

The recent social progress stagnation is a global phenomenon, impacting almost every region of the world:

North America has seen a steady decline in social progress since 2011, with the downturn accelerating since 2020.

Europe saw solid improvement in social progress until 2020 but has stagnated since then.

East Asia & the Pacific saw strong growth in social progress from 2011 to 2022 (7.67 points) but has slightly declined since then.

South Asia also experienced strong growth (7.12 points) from 2011 to 2023 but stagnated in the last year.

Sub-Saharan Africa has improved by 6.45 points from 2011 to 2024 but has slowed since 2020.

Latin America & the Caribbean is the only region in the world to show an uptick in performance in 2024, but this follows a period of slow progress (3.31 points from 2011 to 2023).

Middle East & North Africa has grown slowly throughout the period (4.91 points from 2011 to 2024).

Central Asia & the Caucasus recorded a significant increase in performance from 2011 to 2024 (7.74 points) but has slowed since 2020.

Figure 26

Population-weighted World Social Progress Index | 2011 - 2024

Source: AITi Global Social Progress Index

Today, two out of three people live in a country where social progress has stagnated or declined. In the past year, 72 out of 170 countries have made significant improvements, raising their Social Progress Index score by more than 0.25 points. However, 73 countries have experienced stagnation in progress, with annual changes in scores ranging from 0.25 to -0.25 points. An additional 25 countries have faced a significant decline, with scores dropping by more than 0.25 points.

Brazil leads the top ten most improved countries in the world since 2023 (Figure 29), driven by big improvements in rights and freedoms (Figure 30).

Afghanistan leads the list of the ten least improved countries in the world, which also includes the United States (Figure 31).

Since 2011, most countries, like the world in general, have shown improved social progress. The most improved countries have increased their social progress scores by more than nine points, including Nepal, Somalia, Vietnam, Armenia, and Saudi Arabia (Figure 33).

Saudi Arabia has made significant gains in infrastructure (water and sanitation) and in basic and advanced education. Rights remain low (Figure 34).

Since 2011, the countries with the least improvement in social progress experienced significant state breakdown, namely Syria and Venezuela (Figure 35). Afghanistan’s overall decline is smaller but reflects a period of improvement by nearly five points in the decade from 2011 and a decline by nearly five points since Taliban rule was restored. More surprisingly, half of the countries in this group are advanced economies - Australia, New Zealand, Canada, the United Kingdom, and the United States. In part, this reflects slower progress after easier wins are used up. Yet, other advanced countries like Italy, Ireland, and Luxembourg have posted gains of more than four points during this period.

The **United States** is an outlier among advanced economies in showing a decline in social progress over this period (Figure 36).

Analyzing trends by economic groupings reveals a deeper understanding of the state of the world.

The G7 group of major economies has had diverse fortunes (Figure 37). Germany and Japan lead the group. Italy saw strong social progress particularly from 2015 to 2022 but has declined since 2023. France and Canada also showed significant improvement, but both have declined recently. The United Kingdom has stagnated in social progress since 2018, and the United States has been in an accelerating decline.

The major emerging economies with populations over 100 million people showed signs of convergence and improvement until 2020, but their progress has diverged since then (Figure 38). Brazil remains the top performer, which was driven in part by its recovery in the last year driven by political change. Indonesia, Bangladesh, and Nigeria have been the most consistent social progress performers since 2011. Ethiopia has experienced the most significant slowdown since 2020. Other countries experiencing recent reverses include China, Russia, Mexico, India, and Pakistan.

↔ Stagnating Country (change between -0.25 & +0.25 points)

↓ Declining Country (decline of >0.25 points)

The 2025 ALTi Global Social Progress Index full rankings are set out above indicating each country's recent travel direction (Figure 39). The countries are segmented into six tiers based on their performance¹. Detailed country profiles with comparisons against their closest economic peers are available at www.socialprogress.org/alti-global-social-progress-index.

¹ Tiers are established by defining deciles in the Social Progress Index scores across the 14 years and assigned per the following: Tier 1 - first decile, Tier 2 - second and third decile, Tier 3 - fourth and fifth decile, Tier 4 - sixth and seventh decile, Tier 5 - eighth and ninth decile, Tier 6 - tenth decile. This method ensures comparability of tiers across years.

CONCLUSION

01

Today, two out of three people live in a country where social progress has stagnated or declined. The Index shows that advancing social progress is the foundation of thriving economies. While there is no single answer to the challenges of our time, there are opportunities to engage in advancing evidence-based responses to those challenges.

02

While economic growth is correlated with high social progress, economic growth alone is not enough and GDP does not fully explain social progress outcomes. Countries of similar GDP per capita can have widely different levels of social progress and growth without social progress is a real risk. Inclusive economic growth – that delivers social progress - is possible

03

The Index highlights countries that have bucked the global trend of stagnation to deliver real improvement in the lives of their citizens. It also shows that there is so much potential, across countries rich and poor alike, to accelerate social progress.

04

AITi believes private capital, which can embrace different risk profiles and move quickly, could be critical to driving more inclusive world performance and bridging the gap between economic and social progress.

05

For those considering the purpose of their capital, this report highlights four areas of opportunity to make a tangible difference and more broadly provides a treasure-trove of data that can be used to support the alignment of capital with personal values or causes.

REGIONAL PROFILES

The regional profiles examine how each world regions have advanced over time in key aspects of social progress and identify opportunities for improvement. The profiles also serve as a guide, highlighting which countries are leading their regions and which are lagging behind. The Index measures 170 countries across 8 regions. They are divided into 6 tiers of performance.

Find more data insights at:

www.socialprogress.org/alti-global-social-progress-index

NORTH AMERICA

Highest performing region in the world but score declined in 2024.

Only region to show a decline in social progress since 2011 across Housing, Basic Education and Rights & Voice.

Results by components

Highest and Lowest Performers			
Country	SPI Score	Country	Change in score since 2011
Canada	86.02	Canada	0.39
United States	81.65	United States	-1.87

Performance from 2011 - 2024

Year ● 2011 ● 2015 ● 2020 ● 2024

LATIN AMERICA AND CARIBBEAN

Only region to show an uptick in performance in 2024, driven by a recovery in Rights and Voice.

Slow improvement in social progress since 2011. No significant catch up with Europe or North America. Has been overtaken by East Asia and Pacific.

Results by components

World Latin America & Caribbean

Highest and Lowest Performers

Country	SPI Score	Country	Change in score since 2011
Chile	79.49	Paraguay	6.83
Uruguay	79.26	Bolivia	6.20
Costa Rica	79.02	Guyana	6.11
Venezuela	58.33	Nicaragua	0.96

This information is being provided by ALTi Global, Inc. ("ALTi"), exclusively for use by recipient. For the purposes of this disclosure, ALTi includes certain of ALTi's affiliates that are registered as investment advisers with the U.S. Securities and Exchange Commission, (each, an "ALTi Affiliate RIA" and collectively, "ALTi Affiliate RIAs") that provide investment advisory services. Any investment products referred to herein are managed and / or advised by one or more of ALTi Affiliate RIAs. No part of this material may, without ALTi's prior written consent, be copied, photocopied, or duplicated in any form, by any means. ALTi is providing this information solely in connection with providing general investment advisory services and is not in connection offering investment advisory services with respect to any "private funds" that are managed by such ALTi Affiliate RIAs. The information provided is in no way intended to be considered a recommendation, or an offer to sell, or a solicitation of any offer to buy, an interest in any security, by ALTi or any ALTi Affiliate RIA, including an interest in any investment vehicle or any other financial product, including any investment advisory, wealth planning or trust arrangement managed or advised by ALTi or any ALTi Affiliate RIA, nor does it constitute investment, legal, or tax advice with respect to the products and services and it is important that you do not rely on its content when making an investment decision. Neither ALTi nor any ALTi Affiliate RIA make any representations through this information as to whether any security or other financial product is suitable to you or will be profitable. This information is not intended as a formal research report and should not be relied upon as a basis for making an investment decision. You should obtain relevant and specific professional advice before making any decision to enter into an investment transaction.

Investment in securities involves significant risk and has the potential for partial or complete loss of funds invested. Investments are not insured or guaranteed by the Federal Deposit Insurance Corporation (FDIC)

or any other governmental agency. Prospectuses and offering documents should be read thoroughly before investing. No representation is made that any client will or is likely to achieve its objectives, that the strategies, investment process or risk management referenced in the information provided will be successful, or that any client will, or is likely to, make any profit, or will not suffer losses, including loss of principal. Past performance is no guarantee of future results.

Opinions regarding the suitability of investment approaches, including risk allocations and other portfolio decisions, are not tailored to any specific client, do not constitute recommendations, and are solely provided to facilitate discussion. Individual investor portfolios are constructed based on the individual's financial resources, investment goals, risk tolerance, investment time horizon, tax situation and other relevant factors.

Any statements, assertions or the like (collectively, "Statements") regarding prior or future market or other events, or views about investing, are based upon ALTi's beliefs, which may not reflect those of the firm as a whole, unless the information provided includes the source(s) with respect to such Statements. Additionally, ALTi Affiliate RIAs may pursue investment strategies for clients that do not reflect or contradict the beliefs set forth in any Statement at any time, including at the time of publication. The Statements involve inherent risks and uncertainties, both general and specific, many of which cannot be predicted or quantified and are beyond the control of ALTi.

Information given herein is believed to be reliable, but ALTi does not warrant to its completeness or accuracy, nor does ALTi assume any obligation to update or revise such information. Certain information has been provided by and/or is based on third-party sources and, although believed to be reliable, has not been independently verified and ALTi is not responsible for third-party errors.
